

Linked list

Day 5 : Algorithms and Data Structures

Topic: Introduction to ADS

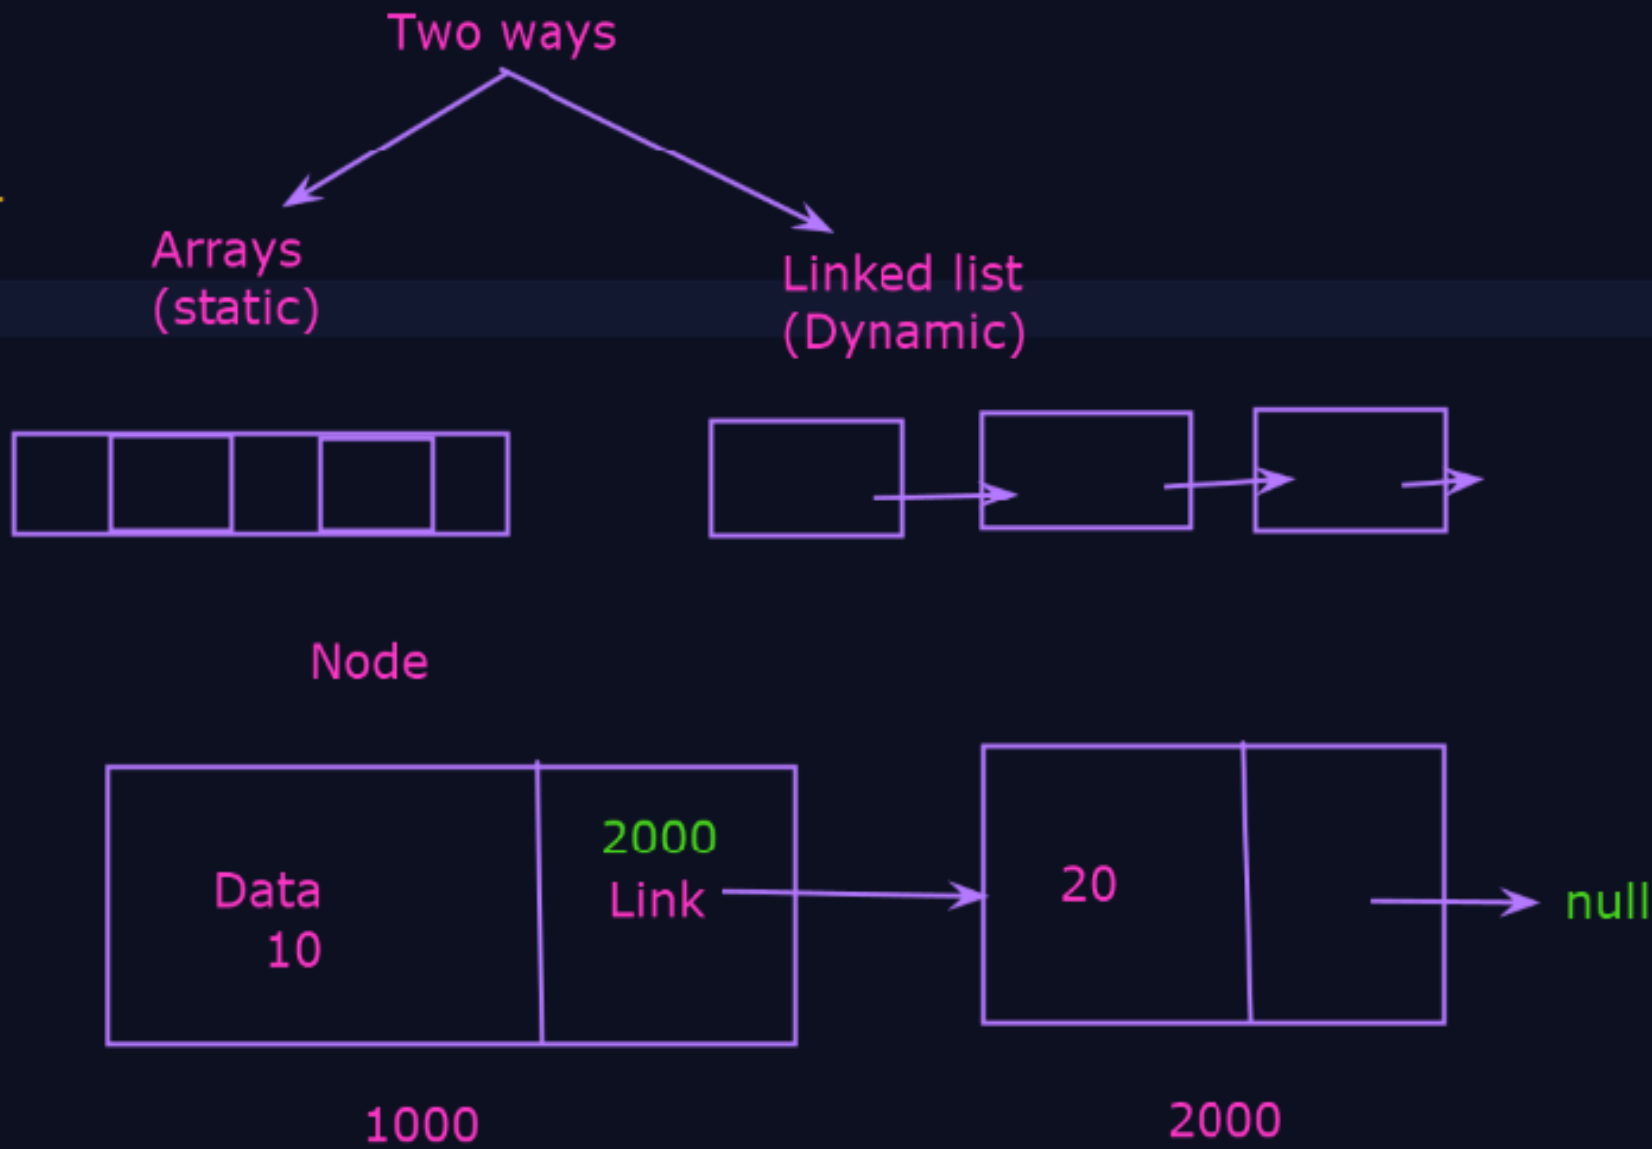

Date: 27/9/2024

Meeting ID: 832 1579 8576

Passcode: 806920

Topics:

- Linked List

Simple Linked List

Node = data + link

-Linked List

Circular Linked list

Node = data + link

500 head = N1

Linked List

- A linked list is a sequence of data structures, which are connected together via links.
- Linked List is a sequence of links which contains items.
- Each link contains a connection to another link.
- Linked list is the second most-used data structure after array.
- Following are the important terms to understand the concept of Linked List.
 1. **Link** – Each link of a linked list can store a data called an **element**.
 2. **Next** – Each link of a linked list contains a link to the next link called **Next**.
 3. **LinkedList** – A Linked List contains the **connection link** to the first link called **First**.

Linked List Representation

- Linked list can be visualized as a chain of nodes, where every node points to the next node.

- As per the above illustration, following are the important points to be considered.
 1. Linked List contains a **link element** called **first**.
 2. Each link carries a **data field(s)** and a **link field** called **next**.
 3. Each link is **linked with its next link** using its **next link**.
 4. **Last link carries a link as null** to mark the end of the list.

Types of Linked List

- **Following are the various types of linked list.**
 1. **Simple Linked List** – Item navigation is forward only.
 2. **Doubly Linked List** – Items can be navigated forward and backward.
 3. **Circular Linked List** – Last item contains link of the first element as next and the first element has a link to the last element as previous.

- **Simple Linked List**

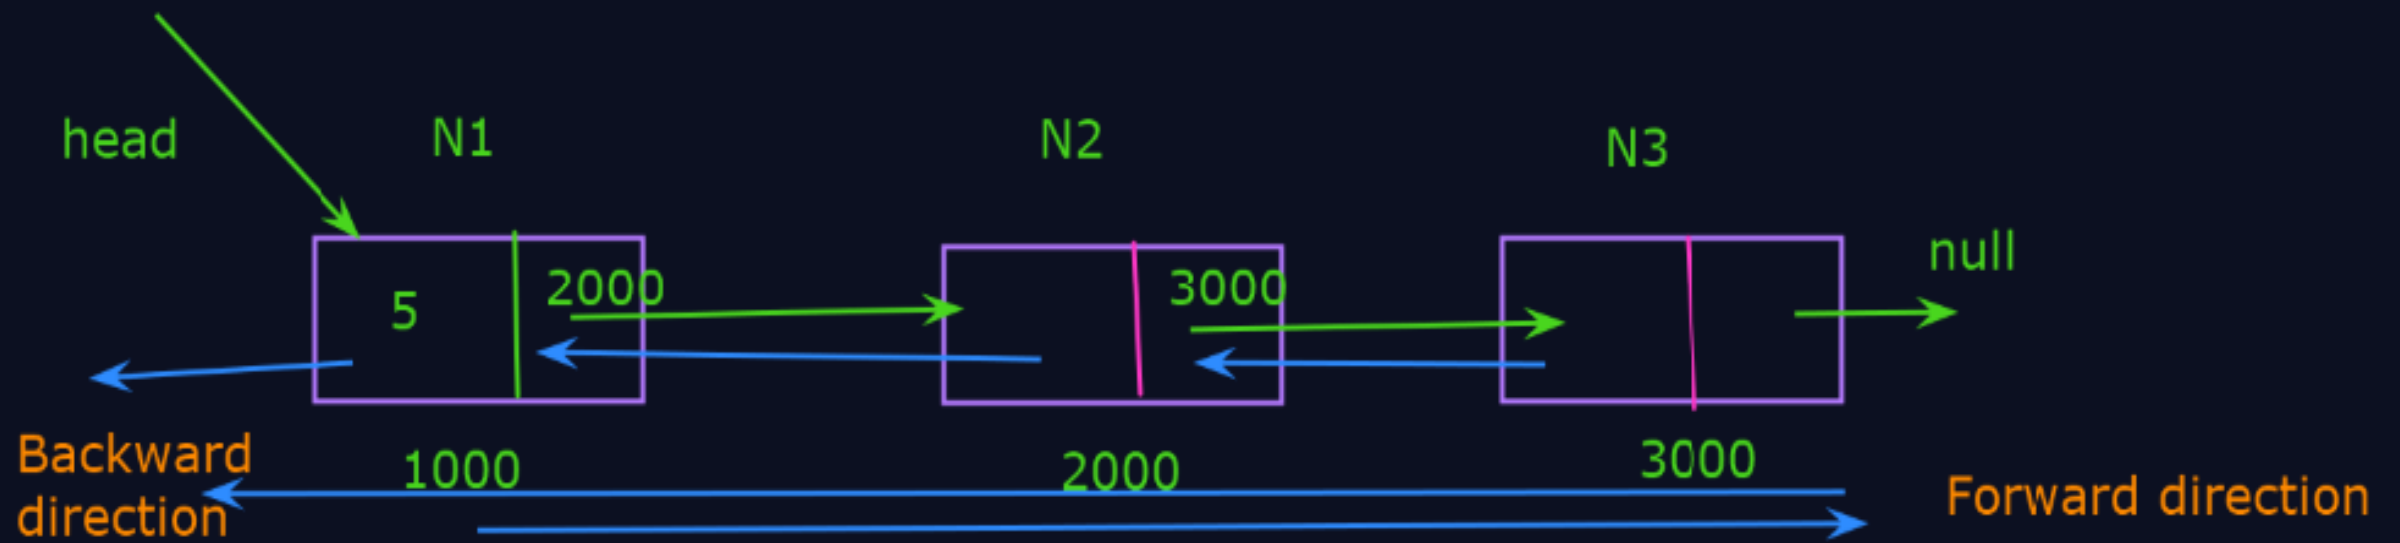

- **Doubly Linked List**

- **Circular Linked List**

Node = data + link

Doubly Linked list

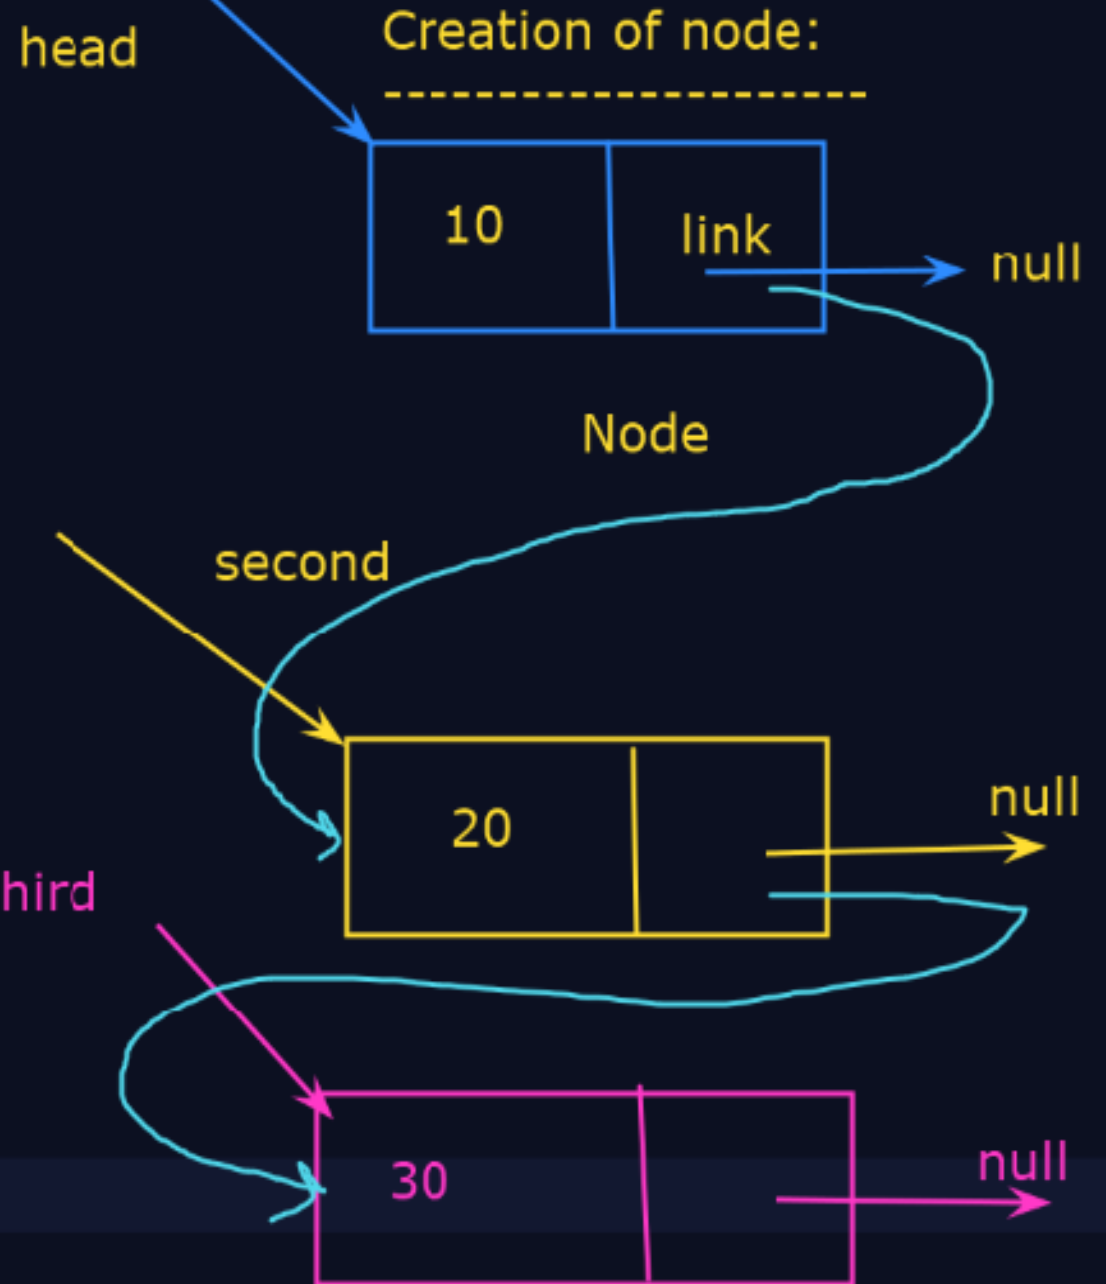

Singly Linked List

- Singly Linked Operations: Insert, Delete, Traverse, search, Sort, Merge

```
Node(int d)
{
    data = d;
    next = null;
}

public static void main(String args[])
{
    LinkedList1 l1 = new LinkedList1();
    l1.head = new Node(10);
    Node Second = new Node(20);
    Node third = new Node(30);
    l1.head.next = second;
    Second.next = third;
}
```

```
void display()
```

```
{
```

```
Node n = head;
```

```
while(n != null)
```

```
{
```

```
System.out.print(n.data+ "---->");
```

```
n=n.next;
```

```
}
```

```
}
```

head

Creation of node:

n

null

Node

second

null

third

null

C:\Windows\system32\cmd

```
D:\Test>javac LinkedList1.java
```

```
D:\Test>javac LinkedList1.java
```

```
D:\Test>javac LinkedList2.java
```

```
D:\Test>java LinkedList2
```

```
D:\Test>javac LinkedList2.java
```

```
D:\Test>java LinkedList2
```

```
10---->20---->30---->
```

```
D:\Test>
```

```
n=n.next;
```

```
}
```

```
}
```

```
void insert(int new_data)
```

```
{
```

```
Node new_node = new Node(new_data);
```

```
new_node.next = head;
```

```
head = new_node;
```

```
}
```

```
void insertafter(Node prev_node, int new_data)
```

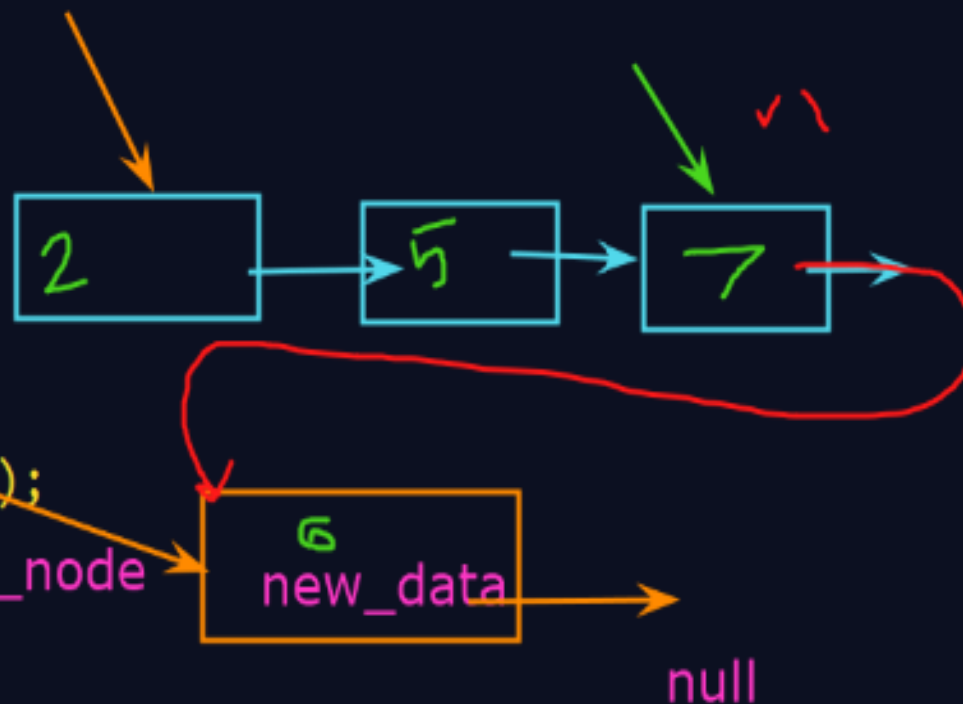

```
{
```

```
Node new_node = new Node(new_data);
```

```
new_node.next = prev_node.next;
```

```
prev_node.next = new_node;
```

```
}
```

Advantages of Linked Lists

1. They are a **dynamic in nature** which allocates the memory when required.
2. Insertion and deletion operations can be **easily implemented**.
3. Stacks and queues can be **easily executed**.
4. Linked List **reduces the access time**.

Disadvantages of Linked Lists

1. The memory is wasted as pointers require extra memory for storage.
 2. No element can be accessed randomly; it has to access each node sequentially.
 3. Reverse Traversing is difficult in linked list.
-

Applications of Linked Lists

1. **Linked lists are used to implement stacks, queues, graphs, etc.**
2. **Linked lists let you insert elements at the beginning and end of the list.**
3. **In Linked Lists we don't need to know the size in advance.**

Basic Operations

- **Following are the basic operations supported by a list.**
 1. **Insertion** – Adds an element at the beginning of the list.
 2. **Deletion** – Deletes an element at the beginning of the list.
 3. **Display** – Displays the complete list.
 4. **Search** – Searches an element using the given key.
 5. **Delete** – Deletes an element using the given key.

Thanks
